<b>Course content</b>	<p>A successful organization must learn to assess potential risks and opportunities and derive adequate conclusions for its strategy. Since the future is open, this requires an approach which supports decision-making in an environment of significant uncertainty.</p> <p>In this course we convey approaches and techniques for developing future scenarios. These are applied to specific realms of society in a practical explorative exercise. Students learn to apply different methods and applications which are used by organizations and businesses in the real-world today.</p> <p>From the beginning, student teams compile information on their specific future space, gained from literature research and communication with experts. The information is structured using a specific option space matrix in order to derive consistent and realistic subscenarios using the so-called morphological analysis. The following future spaces will be explored: food &amp; agriculture, communication &amp; inclusion, beliefs &amp; culture, health &amp; well-being, work &amp; business, leisure &amp; consumption, education &amp; learning, cities &amp; settlements, global order. These subscenarios are then combined to comprehensive scenarios using a consistency analysis approach.</p> <p>The objective of this course is to develop an understanding of how perceptions about the future may be scientifically developed, articulated and embedded in real strategic planning processes.</p>
